Website creation 1 HTML-CSS-*(JS)* (2016-11-07)

Class 5
Navigation

Multiple pages

A single page is not a web site.

We really need more than one page to make a site and those pages need to be 'linked' together.

Nav1.html

Nav2.html

1. Save the two pages opposite to your 'coderdojo2016' directory. {right click, save link as … }
2. Open the first one in chrome.
3. Notice what happens when you click the links between the pages.

Let's add a menu bar to make this better

1. Open nav1.html in notepad++.
2. Add the html code in blue (opposite) to the file and save it.
3. Open nav2.html and add the same code.
4. Now go back to chrome and refresh. And see how the menu bar looks and works.

```html
<body class="w3-container w3-light-blue">

  <ul class="w3-navbar w3-card-8 w3-light-grey">
    <li><a href="nav1.html">Introduction</a></li>
    <li><a href="nav2.html">Details</a></li>
  </ul>

  <header ...
```

Now let's add a home page (part 1)

1. Create a file called nav.html in your codedojo2016 dir.
2. Save the page opposite to your 'coderdojo2016' directory. {right click, save link as … }
3. Open the page in chrome and see how it links to the other two pages.

Nav.html

Is there a link back to the home page from the introduction or detail pages?

Now let's add a home page (part 2)

We need to add in a navigation back to the home page.

1. Add the code (in blue) to both nav1.html and to nav2.html.
2. Open (make sure you have saved the changes) the nav.html page and see how the navigation works now.

```
<li><a href="nav2.html">Details</a></li>
 <li class="w3-right" ><a href="nav.html">Home</a></li>
</ul>
```
